

praecautio

safeguard your facility: fast - accurate - reliable

Water is a precious and limited resource.

Water is a precious resource. It is of utmost importance that it is conserved. Part of this conservation is to make sure that the quality of the water that we do have is of the highest standards. This applies to both the water that is supplied for people to use in their homes, and water in natural waterways.

Faecal contamination lowers the quality of water, causing disease in people who use it for washing or drinking, and upsetting the finely-tuned ecosystems in natural waterways.

Monitoring of water quality can be challenging.

Monitoring of faecal contamination is often difficult. Laboratory water tests can be expensive and often the turn-around time does not allow for quick reaction to a potential problem. Then there is the problem of actually getting the samples to the laboratory. If the sample does not reach the laboratory in good time, the result can be inaccurate.

The solution:

The Praecautio Water Tests have been designed for the African context.

- Easy to use
- Results within 18-24 hours
- Inexpensive
- No need for a laboratory or professional scientist

Now monitoring water quality in those outlying municipal areas or wetlands is not only possible, but easy and inexpensive.

Praecautio Water Tests are available in the smaller 10ml tests and a larger 100ml test.
